# 1 cut

For extracting sections of lines from input to stdout

## 1.1 Useful flags

```
cut -f
```

→ Field numbers (use with -d)

```
cut -d
```

→ Cut delimiter (default: TAB)

## 1.2 Example uses

```
cut -d',' -f2 data.csv
```

→ Extracts second column from data.csv

```
cut -d',' -f1,3 data.csv
```

→ Extracts column 1 and 3 from data.csv

```
cut -d',' -f2-4 data.csv
```

→ Extracts columns 2-4 of data.csv

```
echo "abcdef" | cut -c2-4
```

→ Outputs bcd

## 2 datamash

For quick stats from CLI

### 2.1 Syntax

`datamash [OPTIONS] operation column`

### 2.2 Useful operations

`count`

→ Number of rows

`sum`

→ Sum of numeric values

`mean`

→ Average

`min/max`

→ Minimum/Maximum

`uniq`

→ Unique values (sort first)

`groupby`

→ Group rows by a column (use with sort)

### 2.3 Useful flags

`-t <DELIM>`

→ Set field delimiter (e.g `-t','` to separate by commas for .csv)

### 2.4 Example uses

`datamash -t',' sum 2 < data.csv`

→ Sums 2nd column

*#Compute mean for 1st column in .txt*

```
cat gene_counts.txt | datamash mean 1  
30.785308441558
```

→ Compute mean for 1st column in .txt file

## 3 grep

For finding occurrences within files

### 3.1 Useful flags

1. `grep -w` to only get exact occurrence/whole word instead of part of another.
2. `grep -c` to print number of occurrences (line counts) to stdout instead of the actual occurrences
3. `grep -A NUM` for NUM count of lines after grep target to stdout

### 3.2 Example uses

```
$ cat vombaticus.gff3 | cut -f 3 | grep tRNA
```

```
tRNA
tRNA
tRNA
tRNA
tRNA
tRNA
tRNA
tRNA
```

```
$ cat vombaticus.gff3 | cut -f 3 | grep -c tRNA
```

```
8
```

```
$ grep -A1 ">" file.fa
```

To find header of new fasta when separated by >

## 4 sort-uniq-count-rank

For organising counts in datasets - Essentially runs `sort | uniq -c | sort -rn`

### 4.1 Example uses

```
cat vombaticus.gff3 | cut -f 3 | sort-uniq-count-rank
```

```
`386346 exon`  
`364707 CDS`  
`46571 biological_region`  
`40512 ###`  
`32886 mRNA`  
`29973 five_prime_UTR`  
`21114 gene`  
`20531 three_prime_UTR`  
`15416 region`  
`3318 ncRNA_gene`  
`1911 lnc_RNA`  
`700 snRNA`  
`577 pseudogene`  
`577 pseudogenic_transcript`  
`543 miRNA`  
`462 transcript`  
`311 snoRNA`  
`22 tRNA`  
`19 scRNA`  
`13 rRNA`  
`6 Y_RNA`  
`2 V_gene_segment`  
`1 #!genebuild-last-updated 2019-02`  
`1 #!genome-build bare-nosed_wombat_genome_assembly`  
`1 #!genome-build-accession GCA_900497805.2`  
`1 #!genome-date 2018-12`  
`1 #!genome-version bare-nosed_wombat_genome_assembly`  
`1 ##gff-version 3`  
`1 J_gene_segment`
```

## 5 tr

For ‘trapping’ stdin. Takes input and translates, squeezes, or deletes characters. Use with `echo`, pipes, or redirections.

### 5.1 Syntax

```
tr [OPTION] SET1 [SET2]
```

### 5.2 Useful flags

(none)

→ Translate SET1 to SET2

```
tr -d
```

→ Delete characters in SET1

```
tr -s
```

→ Squeeze repeated characters into one

```
tr -c
```

→ Complement SET1 (ie match everything else)

### 5.3 Example uses

```
echo "hello" | tr 'a-z' 'A-Z'
```

→ HELLO

```
`tr "\n" " "
```

→ Converts newlines to spaces

```
echo "hello 123" | tr -d '0-9'
```

→ hello (deletes characters - numbers here)

```
tr -d '\n' < file.txt
```

→ Removes newlines (flattens text)

## 6 `wc`

For printing wordcount, newline count, and byte counts of file

### 6.1 Useful flags

`wc -l`

→ Line counts

`wc -w`

→ Word counts

`wc -c`

→ Byte counts

`wc -m`

→ Character counts (UTF-8)

### 6.2 Example uses

`wc -l file.txt`

→ Outputs line count for file.txt

`cat file.txt | wc -l`

→ Pipe into word count (same output as above)

`grep "apple" file.txt | wc -l`

→ Counts how many lines contain `apple`

## 7 wget

For recursive downloading files from the internet
